Self-Practice Questions

Q.1. Create a suitelet form which will consist of customer dropdown field, we will select one customer and submit the suitelet form. The submit button will trigger shedule mail which will send mail to the selected customer.

Ans.

1.Suitlet script to create a form and use task module to call shedule script

```
/**
* @NApiVersion 2.1
* @NScriptType Suitelet
*/
define(['N/record', 'N/ui/serverWidget','N/http', 'N/task'],
    /**
* @param{record} record
* @param{serverWidget} serverWidget
*/
    (record, serverWidget, http, task) => {

      function onRequest(scriptContext) {
            if (scriptContext.request.method === 'GET'){
               let form = serverWidget.createForm({
               title: 'Customer Form'
            });

            let select = form.addField({
               id: 'custpage_customer_name',
               type: serverWidget.FieldType.SELECT,
               label: 'Customer',
               source: 'customer'
            });

            form.addSubmitButton({
               label: 'Send Mail'
            });

            scriptContext.response.writePage(form);
            }
            else if (scriptContext.request.method === 'POST')
            {
                  const delimiter = /\u0001/;
                  const customerName = scriptContext.request.parameters.custpage_customer_name;
```

```
               type: serverWidget.FieldType.SELECT,
               label: 'Customer',
               source: 'customer'
            });

            form.addSubmitButton({
               label: 'Send Mail'
            });

            scriptContext.response.writePage(form);
            }
            else if (scriptContext.request.method === 'POST')
            {
                  const delimiter = /\u0001/;
                  const customerName = scriptContext.request.parameters.custpage_customer_name;
                   var scheduledScript = task.create({
                        taskType: task.TaskType.SCHEDULED_SCRIPT
                   });
                    scheduledScript.scriptId = 'customscript_schedule_script';
                    scheduledScript.deploymentId = 'customdeploy_shedule_script_deploy';
                    scheduledScript.params = {
                          'custscript_customer_name' : customerName
                  };
                    var scriptTaskId = scheduledScript.submit();
                    log.debug("id", scriptTaskId);
                    scriptContext.response.write('customer name ' + customerName );
            }
      }

    return {
        onRequest: onRequest
    };
});
```

2.Shedule script which will send email to selected customer

```
/**
 * @NApiVersion 2.1
 * @NScriptType ScheduledScript
 */
define(['N/currentRecord' , 'N/runtime' , 'N/task' , 'N/email' ],

    (currentRecord, runtime , email) => {

        const execute = (scriptContext) => {

            var customer_id = parseInt(runtime.getCurrentScript().getParameter({
                name : 'custscript_customer_name',
            }))
            log.debug({
                title : 'Shedule Script has been execute',
                details : customer_id,
            });
            email.send({
                author: -5,
                recipients: customer_id,
                subject: 'This Email has been send by Kathryn Glass through shedule mail',
                body: 'Suitelet-Shedule Script',

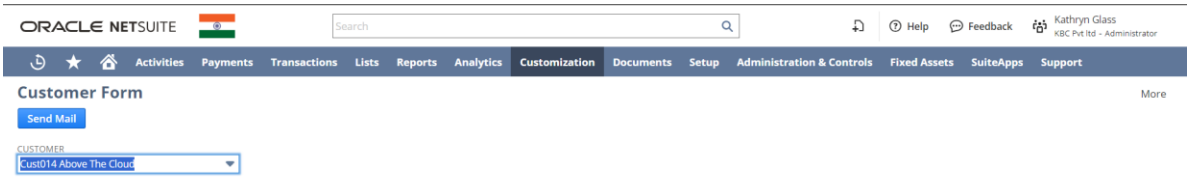
            });

        };

        return {execute};

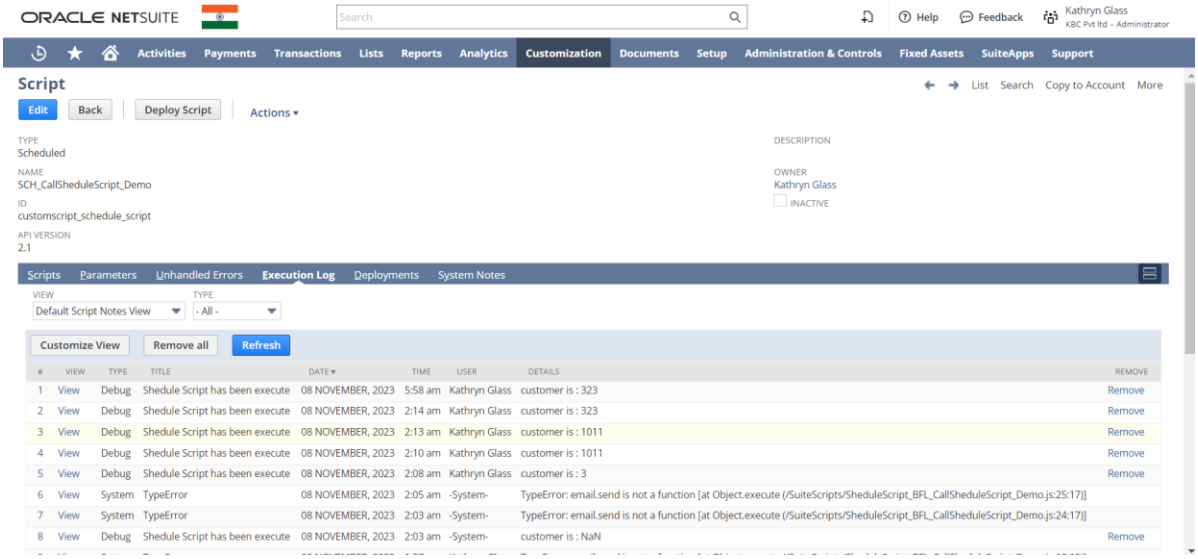
});
```

3.Suitelet form and customer is “The above cloud”

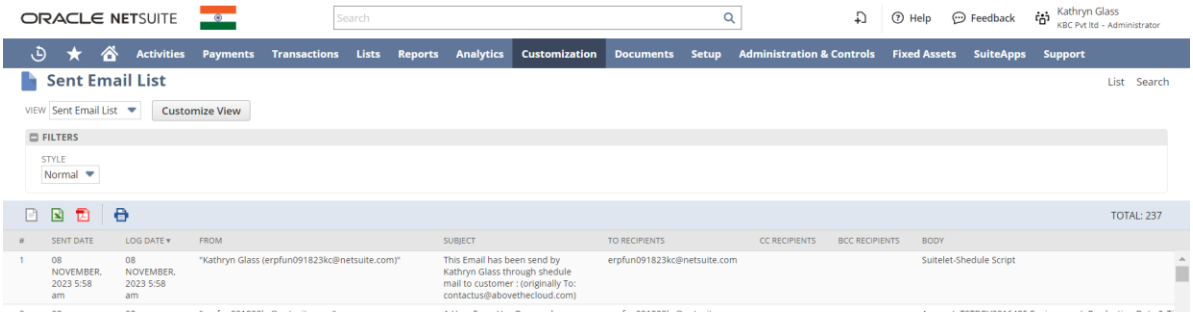


customer name 323

4.Customer Id has been fetched in shedule script



5.Email has sent to “The above cloud” customer



Q.2. Create a suitelet form which will consist of customer dropdown field, we will select one customer and submit the suitelet form. The submit button will fetch sales order has been created for selected customer.

Ans.

1.Suitelet form to select customer name

2.Then we will create new form in 'post' and using saved search we will fetch sales order of customer and display on suitelet

```
/**
* @NApiVersion 2.1
* @NScriptType Suitelet
*/
define(['N/record', 'N/ui/serverWidget', 'N/http', 'N/task', 'N/search'],
    /**
* @param{record} record
* @param{serverWidget} serverWidget
*/
    (record, serverWidget, http, task, search) => {
        /**
         * Defines the Suitelet script trigger point.
         * @param {Object} scriptContext
         * @param {ServerRequest} scriptContext.request - Incoming request
         * @param {ServerResponse} scriptContext.response - Suitelet response
         * @since 2015.2
         */
        function onRequest(scriptContext) {
            if (scriptContext.request.method === 'GET') {
                let form = serverWidget.createForm({
                    title: 'Customer Form'
                });

                let select = form.addField({
                    id: 'custpage_customer_name',
                    type: serverWidget.FieldType.SELECT,
                    label: 'Customer',
                    source: 'customer'
                });

                form.addSubmitButton({
                    label: 'Search'
                });
```

```
                    source: 'customer'
                });

                form.addSubmitButton({
                    label: 'Search'
                });

                scriptContext.response.writePage(form);
            }
            else if (scriptContext.request.method === 'POST') {
                const delimiter = /\u0001/;
                const customerName = scriptContext.request.parameters.custpage_customer_name;

                var formSalesOrder = serverWidget.createForm({
                    title: 'Sales Order'
                });

                var sales_sublist = formSalesOrder.addSublist({
                    id: 'sales_order_sublist',
                    type: serverWidget.SublistType.LIST,
                    label: 'Sales Orders'
                })

                sales_sublist.addField({ id: "tranid", type: serverWidget.FieldType.TEXT, label: "Sales Order Number" });
                 sales_sublist.addField({ id: "entity", type: serverWidget.FieldType.TEXT, label: "Customer Name" });
                                sales_sublist.addField({ id: "account", type: serverWidget.FieldType.TEXT, label: "Account" });

              sales_sublist.addField({ id: "trandate", type: serverWidget.FieldType.TEXT, label: "Date" }),
