## CUSTOMIZATION OF DASBOARDS AND ROLES

Q.1. What is Dashboard in NetSuite ? What we can do using dashboards in netSuite ?

Ans.

- A dashboard is a customizable, visual interface that provides users with a real-time overview of key performance indicators (KPIs) and important data related to their business operations.
- Dashboards are designed to help users monitor and analyze data at a glance, enabling them to make informed decisions quickly.

We can use dashboard for:

1.Key Performance Indicators (KPIs):
- Dashboards allow us to track and visualize important KPIs such as sales revenue, expenses, profit margins, inventory levels, and more. This helps stay informed about the business progress.

2.Customize Data Views:
- We can customize dashboard to display data that is relevant to specific role and responsibilities. Add, remove, or rearrange widgets to create a personalized view of our data. We can add quick form on dashboard to create new customer , employee , vendor or sales order etc.
- We can display records like customer record , Item record etc on dashboard.
- We can add reminders , saved search etc.
- Dashboards typically provide real-time or near-real-time data, ensuring that we have the most up-to-date information.

4.Drill-Down for Details:
- We can often click on charts, graphs, or data points on the dashboard to access more detailed information, such as transaction records or reports.

5.Set Alerts and Notifications:
- Configure alerts and notifications to receive updates when certain conditions are met. For example, we can set up alerts to notify when a sales order is approved or when inventory levels reach a critical threshold.
- Or we can set alert for Netsuite updates.

6.Track Sales and Customer Data:
- Sales representatives and customer service teams can use dashboards to track sales orders, customer interactions, and customer support metrics.

7.Manage Financial Data:
- Finance professionals can monitor financial statements, track expenses, view accounts receivable and payable, and keep an eye on cash flow.

8.Analyze Inventory:
- Inventory managers can use dashboards to monitor stock levels, track reorder points, and analyze inventory turnover.

9.Review Project Progress:

- Project managers can create dashboards to track project timelines, budgets, and resource allocation for various projects.

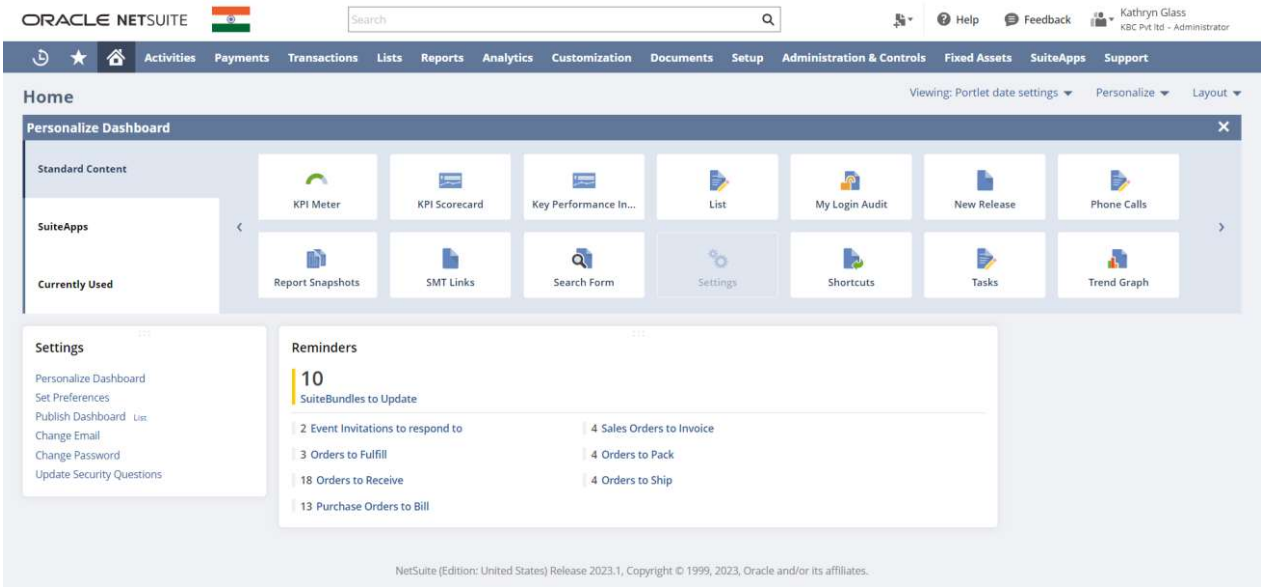
10.Review Employee Performance:

- HR and management can use dashboards to track employee performance metrics, such as productivity, sales quotas, and project completion.

Q.2. What is the navigation for dashboard ? How to personalize dashboard ?

Ans.

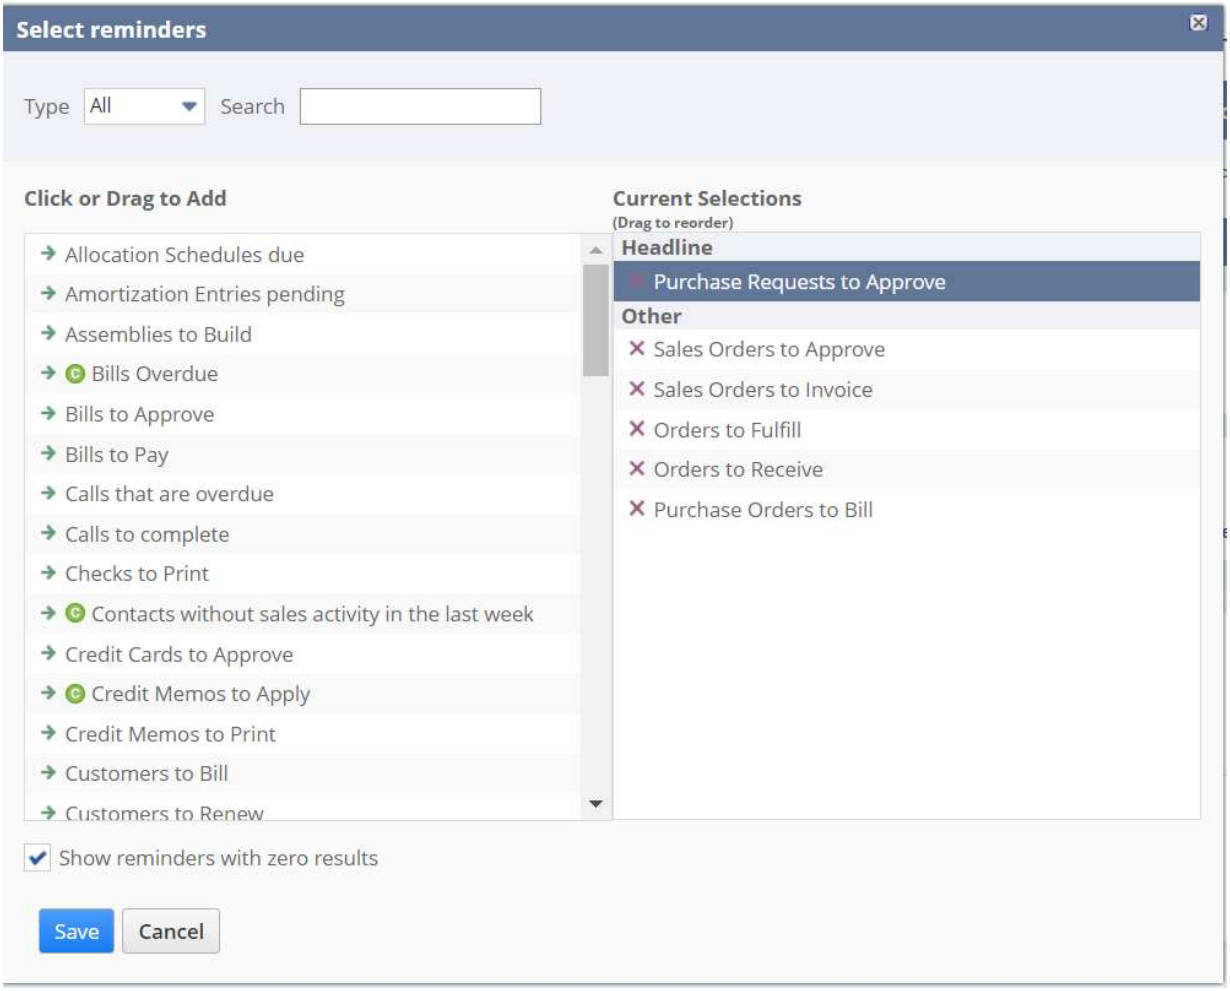
- Navigation for dashboard : Login > Home icon > Dashboard
- Personalize dashboard : Home icon > Dashboard > Personalize
- Using portlet of Personalize dashboard we can customize dashboard



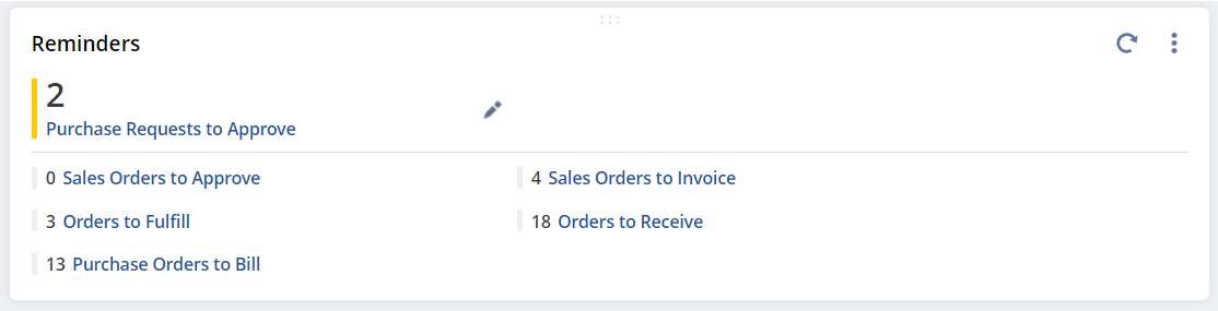
Q.3. Create one reminder with the ‘purchase orders pending for approval status’.

Ans.

- Create a reminder : Login > Home icon > Dashboard > Personalize > Standard content > Reminders > Set up > Search “Purchase” > Drag “Purchase request to approve” to headline > Select “show reminder with zero results”



- Reminder has been set



Q.4. If you want ‘Reminder’ portlet down to the page. How you can do this ?

Ans. Create a reminder : Login > Home icon > Dashboard > Personalize > Standard content > Reminder > Drag and drop to the down of page.

Q.5. What is Role in NetSuite ? What is the navigation ?

Ans.

- Role defines the permissions, access, and responsibilities for each user within the system. Roles are used to control what a user can see and do in the NetSuite environment.
- Navigation for roles: Setup > User/Roles > Manage roles
- Navigation to create role : Setup > User/Roles > Manage roles > New

Permissions:

- Roles determine which records and functions a user can access. NetSuite uses a role-based permission model, which means that each role has specific permissions associated with it. These permissions can be highly granular, controlling access to particular record types, transactions, reports, and even specific fields within records.

Responsibilities:

- Roles also define the responsibilities or tasks a user is expected to perform within the organization. For example, a sales representative may have a role that grants access to customer records, sales orders, and sales reports.

Access Levels:

- Within each role, we can specify different access levels, such as View, Edit, and Full. This allows for fine-grained control over what users can do with the data they have access to.

Dashboards:

- Roles can also determine the default dashboard that a user sees upon logging in. This helps user experience to their specific needs and responsibilities.

Center Tabs:

- Center tabs are the main navigation tabs in NetSuite (e.g., Home, Lists, Transactions, Reports). Roles can control which tabs a user has access to and the level of access within each tab.

Customization Access:

- Roles can control whether a user can customize the NetSuite environment, such as creating saved searches, custom fields, or reports.

Scripting and Automation Access:

- Roles also dictate access to NetSuite's SuiteScript, SuiteFlow, and SuiteBuilder tools for scripting and automation. This is essential for controlling who can create and modify custom scripts and workflows.

Record Access and Restrictions:

- Roles can be used to set up record-level security, ensuring that users can only access records that they should have access to.

Web Services Permissions:

- If organization integrates NetSuite with other systems, roles can control access to web services for these integrations only.

Multi-subsidiary Access:

- In NetSuite OneWorld, which is designed for multinational businesses, roles can specify which subsidiaries a user has access to and what level of access they have.

Q.6. What are the 4 level of permissions ? Explain.

Ans.

Full Access:
- Users with full access have complete access to the associated records and transactions. They can view, create, edit, and delete records based on the role's permissions. This level of access is typically given to administrators or other users who need unrestricted access.

Edit Access:
- Users with edit access can view and edit records but usually cannot create or delete them. They can make changes to existing records and transactions, but they may not have the authority to create new ones or remove existing ones.

Create Access:
- Users with create access can create new records but usually cannot edit or delete them. They can not make changes to existing records and transactions, but they may not have the authority to create new ones but not remove existing ones.

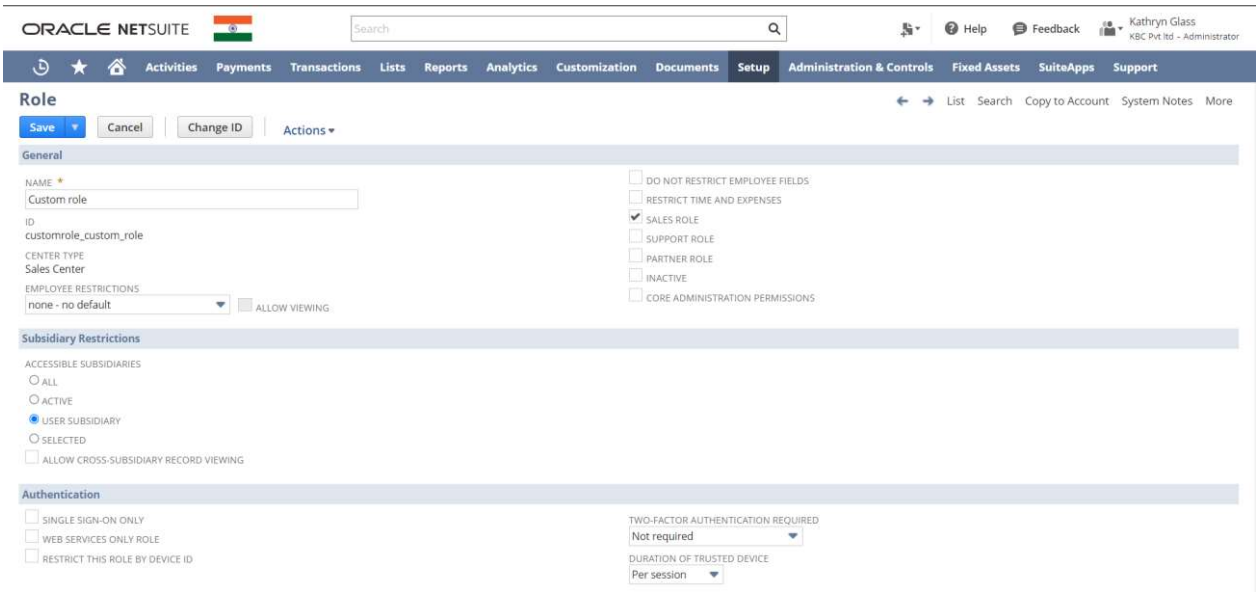
View Access:
- Users with view access can only see the records and transactions associated with their role. They cannot make any changes, and they usually do not have the ability to create or delete records. This level of access is often given to employees who need to view specific information without making any changes.

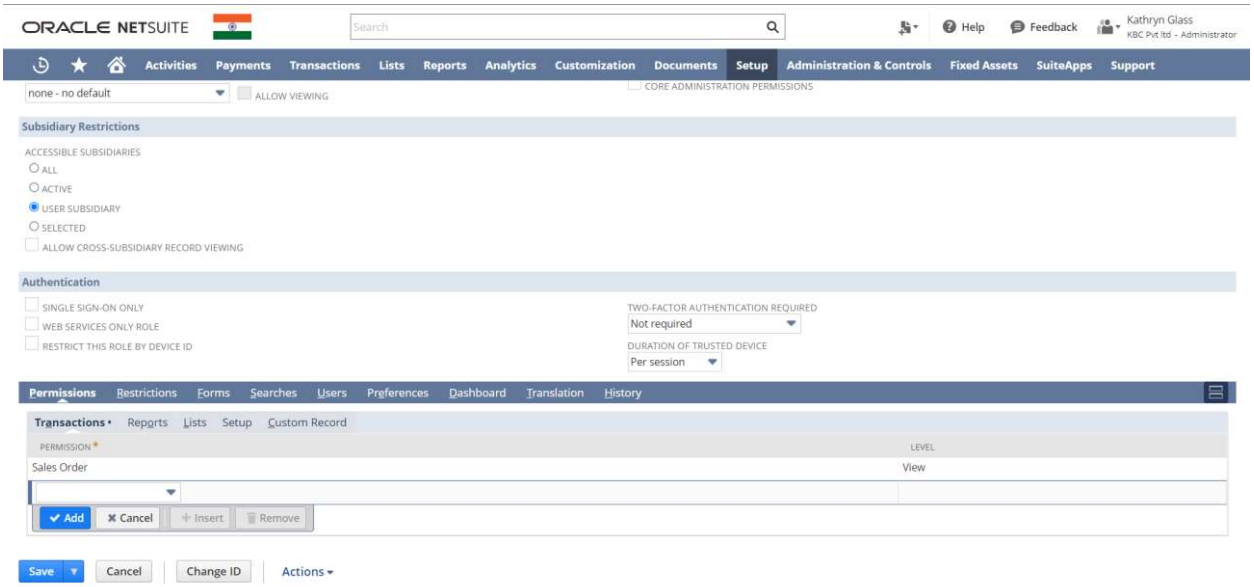
Q.7. Create one custom role and apply the 4 levels of permission on the role. Observe the changes in NetSuite by go to that role.

Ans.

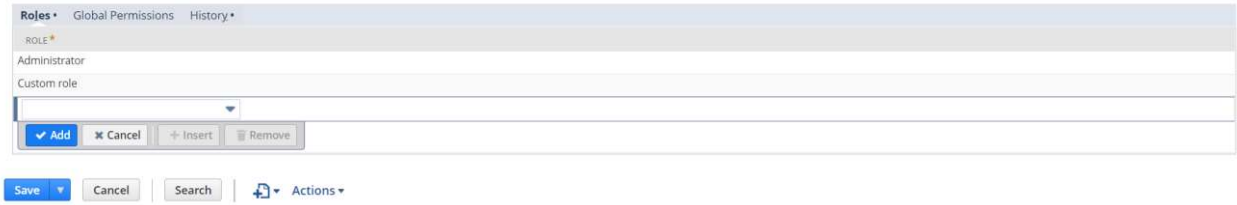
1.ACCESS LEVEL : VIEW

- Create a new role : Setup > Users/Roles > Manage roles > New > Name as “Custom role” > Center type “Sales center” > Permissions > Select “Sales order” > Select level “View” > Save

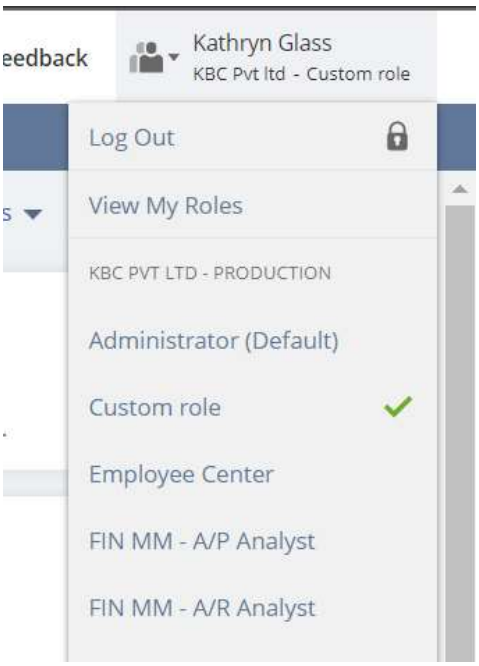




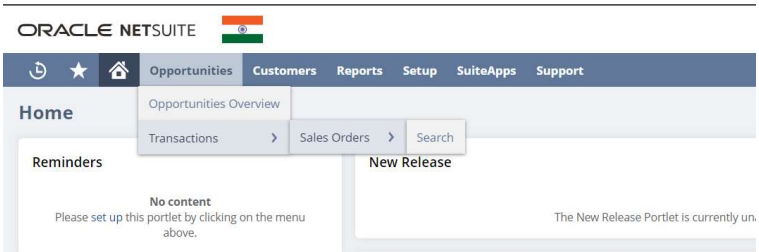
- Assign this role to Kathryn glass: List > Employee > Edit > Access > Role > Assign role “Custom role”



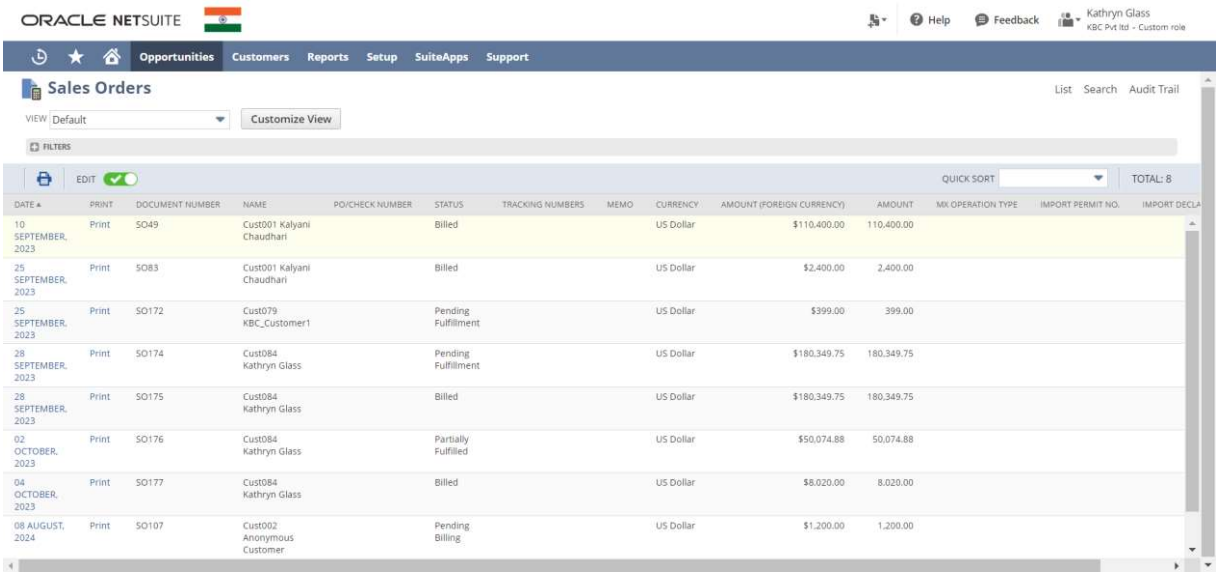
- Login with “Custom role”



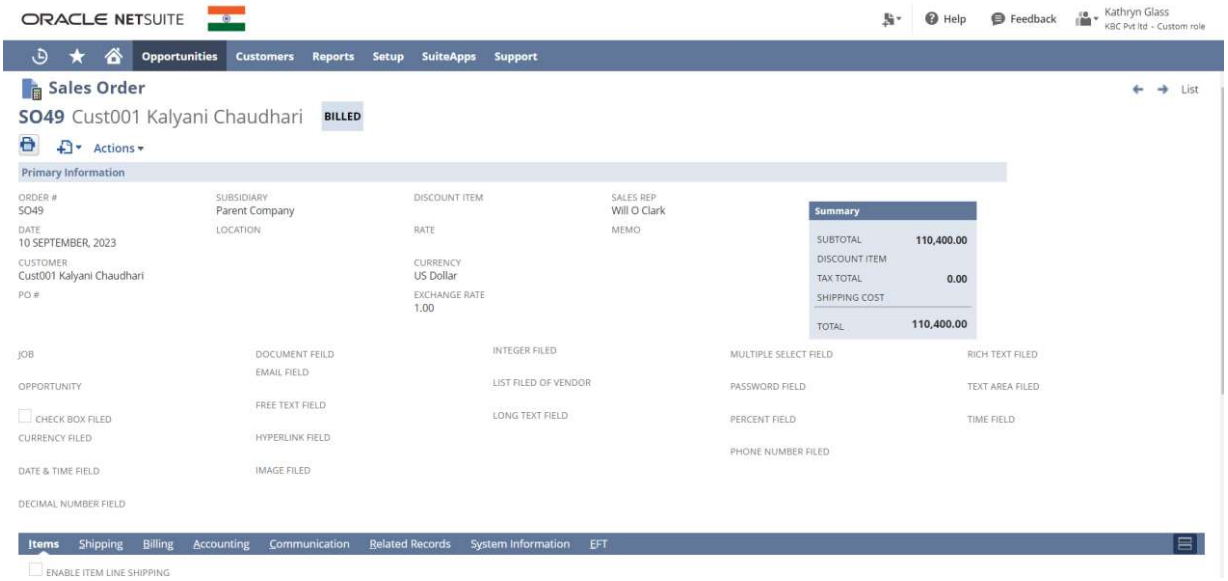
- We can only view / search sales order



- We don’t have access to edit any record



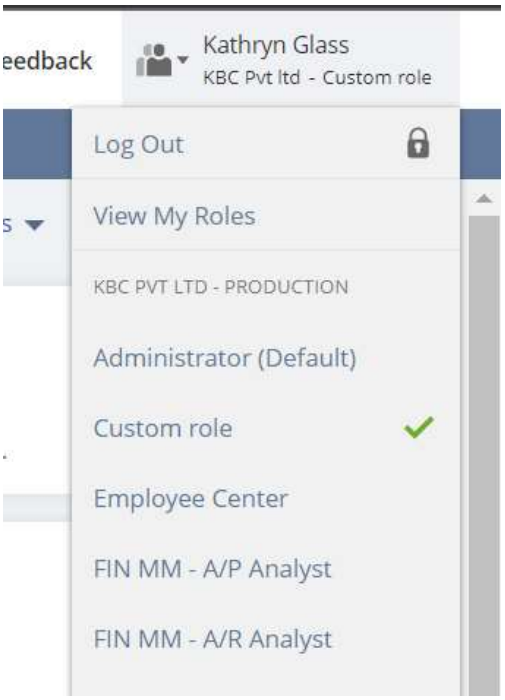
- We can only view record



2.ACCESS LEVEL : CREATE

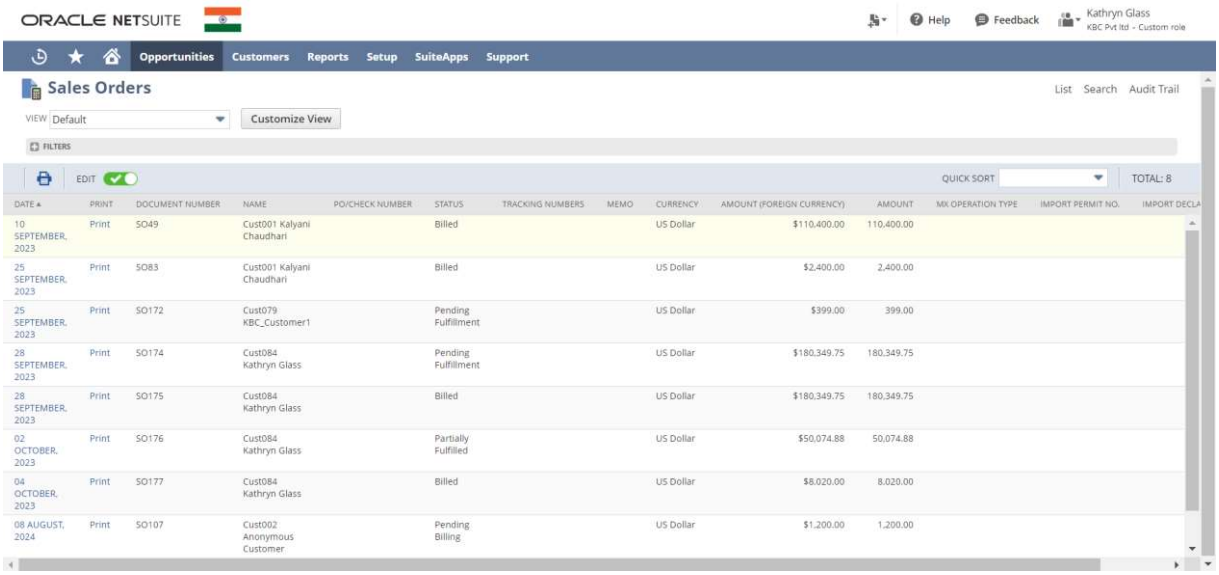
- Again login with administrator role.
- Setup > Users/Roles > Manage roles > Edit “Custom role” > Permissions > Select “Sales order” > Select level “Create” > Save

- Again, Login with “Custom role”

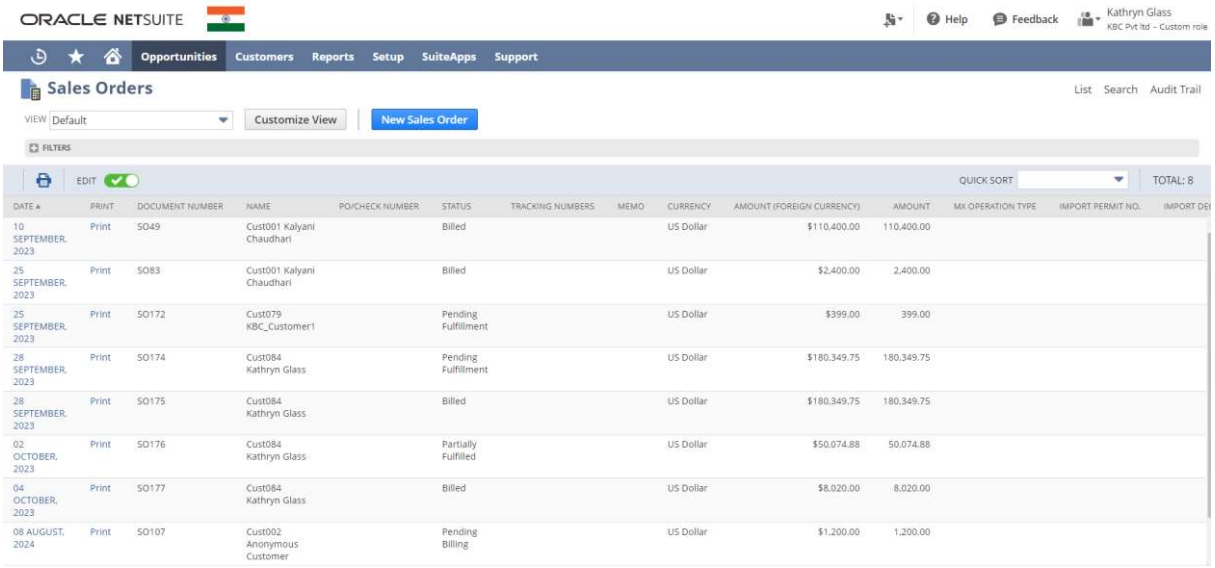


- We can only view / search / create sales order

- We don't have access to edit any existing record or delete any record



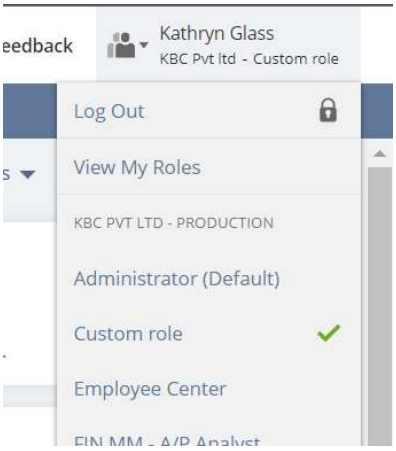
- But now We can also create new sales order



3.ACCESS LEVEL : EDIT

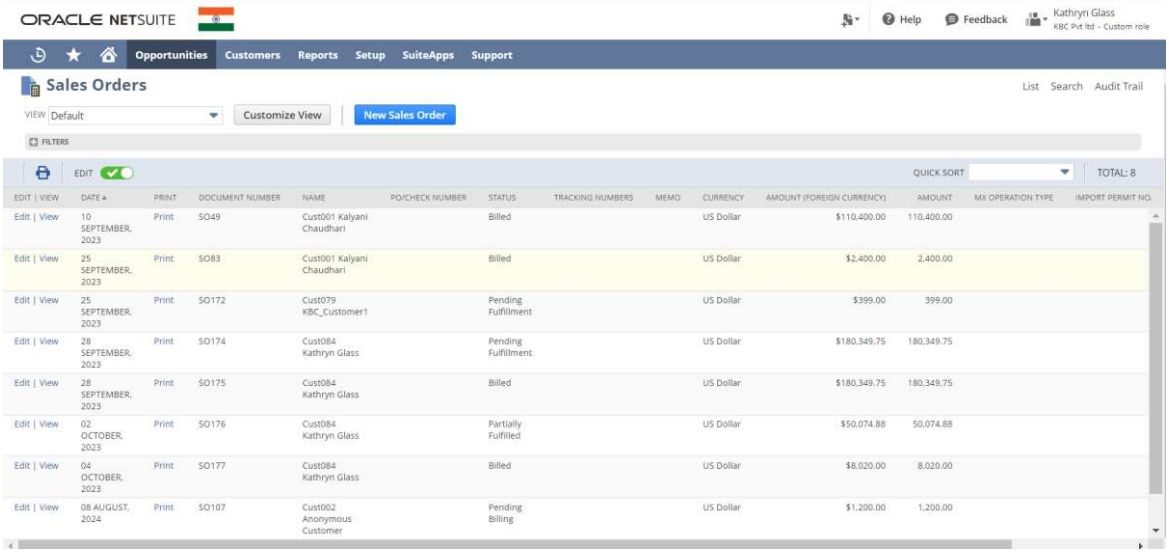
- Again login with administrator role.
- Setup > Users/Roles > Manage roles > Edit “Custom role” > Permissions > Select “Sales order” > Select level “Edit” > Save

- Again, Login with “Custom role”



- We can only view / search / create / edit sales order

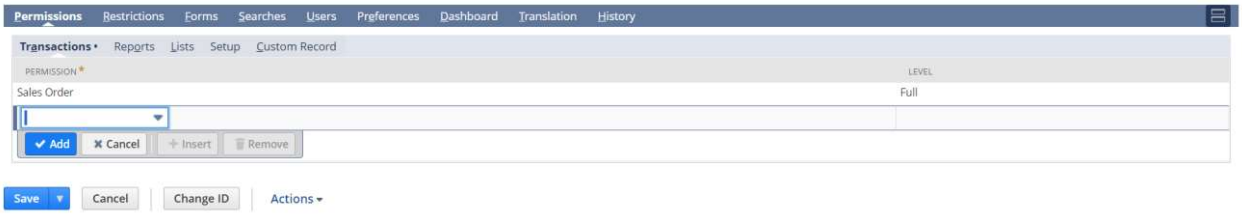
- Now we can edit existing record and create a new record



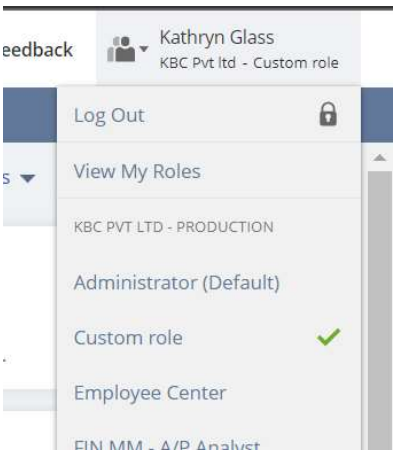
- But still don't have delete record access

4.ACCESS LEVEL : FULL

- Again login with administrator role.
- Setup > Users/Roles > Manage roles > Edit “Custom role” > Permissions > Select “Sales order” > Select level “Full” > Save

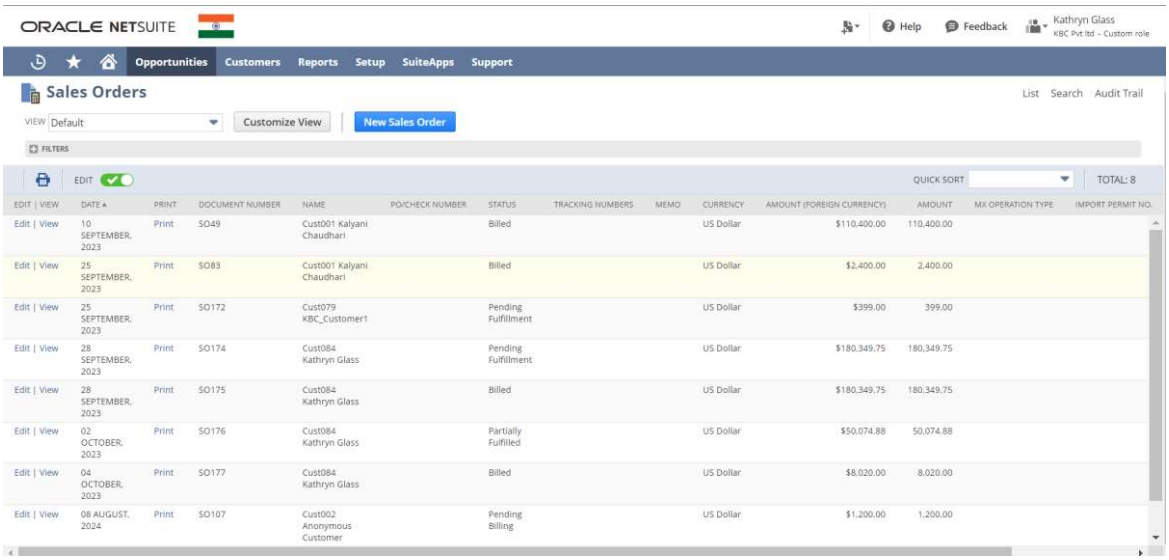


- Again, Login with “Custom role”

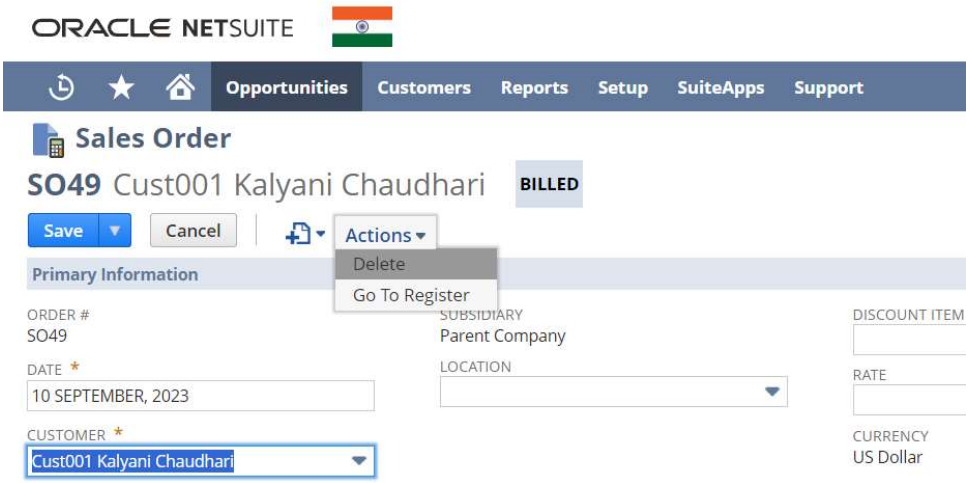


We can only view / search / create / edit sales order

- Now we can edit existing record and create a new record



- Now we can also delete record



Q.8. How we check the roles to the user in the system?

Ans. We can see roles of user in system : Setup > User/Roles > Manage users

Q.9 . Can we change the center type once the role has been created?

Ans.

- We can not change center type once the role has been created
- And if we still want to change role of Employee then we have to create new record for that same employee there we can assign new role which we want to assign
- But this will affect the dependent record
