Data Migration and CSV Imports

Q.1. What is CSV Import? What is the navigation for csv import? Which steps are involved in this process?

Ans.

CSV import:

- CSV (Comma-Separated Values) import is a common operation in software applications and databases. It involves importing data from CSV files into a database or software system.
- CSV files are simple text files that store tabular data with each line representing a row and values separated by commas or other delimiters.
- This operation is commonly used to transfer data between different applications, especially for tasks like data migration or bulk data entry.

Navigation:

- Setup > Import/Export > import CSV record

Steps in CSV import process:

1.Scan and upload csv file:

- Import type: Choose the category of data to import.
- Record type: Choose the record type of data to import.
- Character encoding: Choose another character encoding format
- CSV column delimiter: Select the symbol to be used as a column separator in the CSV files you import.
- Upload csv file

2.Import options:

- Data handling: Here we can select to how we want to migrate our data with exiting record
    - Add
    - Update
    - Add or update

3.File mapping: Here file mapping will be done by NetSuite

4.Field mapping: Here we must map our csv file column name with NetSuite filed

5.Saving mapping & start import

Q.2. What is ADD, UPDATE, ADD OR UPDATE? Explain.

Ans.

Add:

- This action involves creating new records.
- For example, if we have 50 records of employee and we want to add more 100 records of employee without affecting existing employee record then “ADD” import option can be chosen.

Update:

- This action involves modifying existing records.
- For example, if we have employee record with their personal email address, but now organization want to update email address with official outlook email address or want to add new field as a “official mail” in record that time we can choose “UPDATE” import option.

Add or Update:

- This action combines the first two. It means that the synchronization process should both add new records and update existing records.
- Let's suppose,
- We have employee record which don't have field of “DOB”
- now we want to add new employee record with “DOB” with existing employee’s “DOB”
- In this case, we can go with Add or Update import option

Q.3.

1.If you want to create new records in NetSuite by csv import which import option, you have to use?

Ans. If I want to create new records without affecting on existing record then I will choose “ADD” import option.

2.If you want to make changes in the existing records in NetSuite by csv import which import option, you have to use?

Ans. If I want to update existing records by adding new filed or updating existing field then I will choose “UPDATE” import option.

3.If you want to make changes to the existing records or create some new records in NetSuite by csv import which import option, you have to use?

Ans. If I want to create new records and want to update existing records by adding new filed or updating existing field then I will choose “ADD OR UPDATE” import option.

Q.4. What is field mapping? How can we map Csv file fields with NetSuite files?

Ans.

1.Field mapping refers to the process of mapping and defining how data from an external source such as CSV file should be imported and matched to specific fields within our NetSuite account. This is commonly used when we need to import data into NetSuite, such as customer records, sales orders, vendor information, inventory items, or any other type of data.

2.Steps in Mapping of field

- Data Source Selection:

First, we select the source of data, which can be a file we have uploaded or a data connection to another system.

- Mapping:

We need to specify how the columns or fields in our data source correspond to the fields in NetSuite records. For example, if in our csv file has a "Name" column, we need to map it to the "Name" field in NetSuite customer records. This mapping process ensures that data is correctly transferred from our source to the appropriate fields in NetSuite.

- Import Execution:

After configuring the field mapping, we execute the import process. NetSuite uses the mapping rules we have defined to bring data from a source into NetSuite record, populating the specified fields with the data from source.

3.Import CSV

- Create a csv file with employee record, Column name should be same with filed name of Employee form

A	B	C	D	E	F	G	H
FIRST NAME	LAST NAME	JOB TITLE	EMAIL	PHONE	SUBSIDIARY	DEPARTMENT	
Aishwarya	Dasgupta	Associate technical consultant	ad@gmail.com	1111111111	Canada	Engineering	
Debangshi	Nath	Associate technical consultant	dn@gmail.com	1111111112	Canada	Engineering	
Zohal	Quadami	Associate technical consultant	zq@gmail.com	1111111113	Canada	Engineering

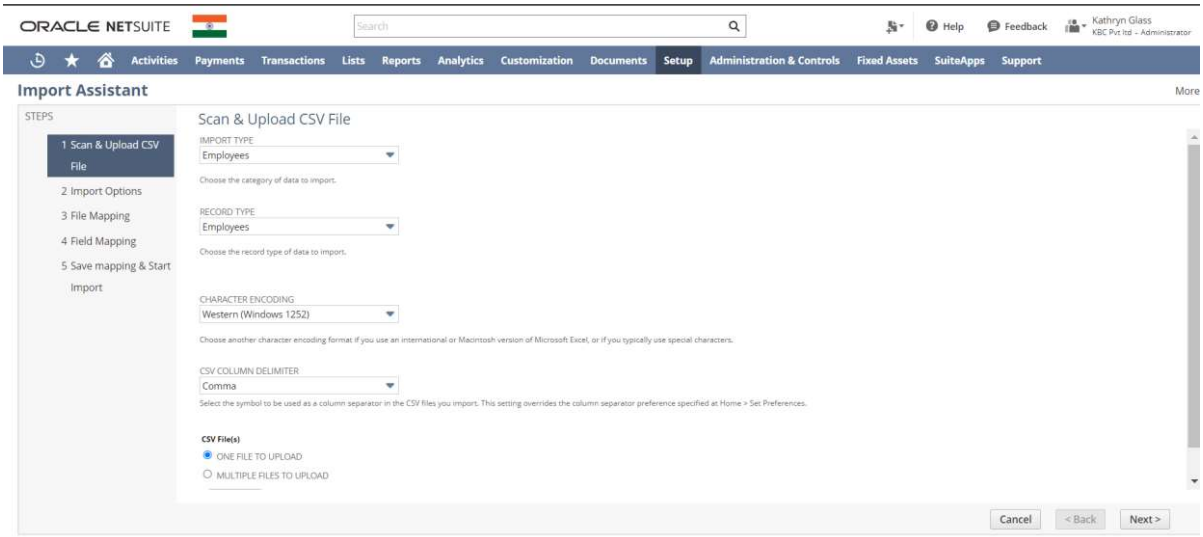
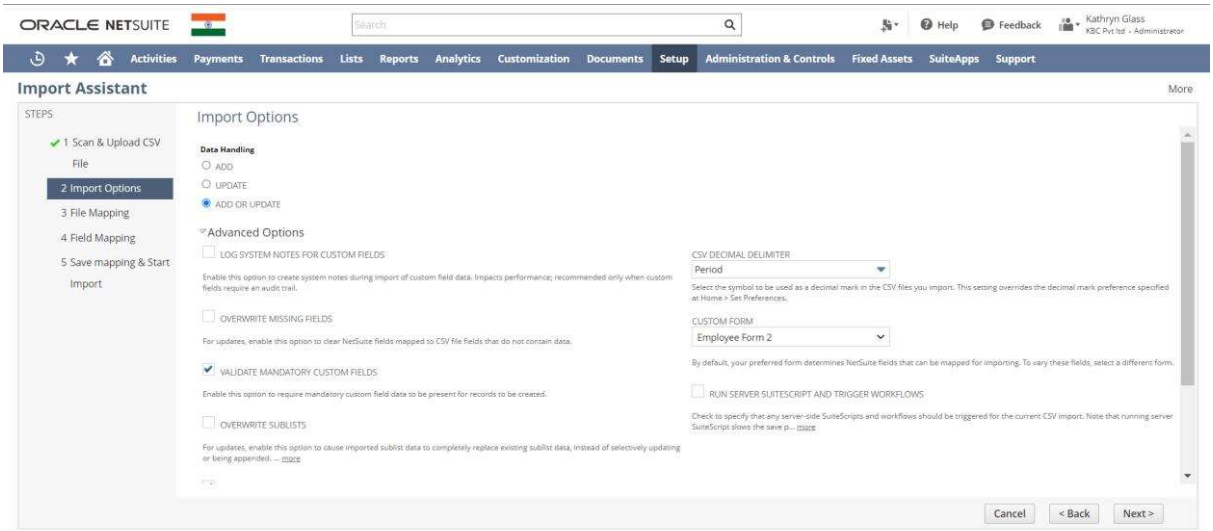
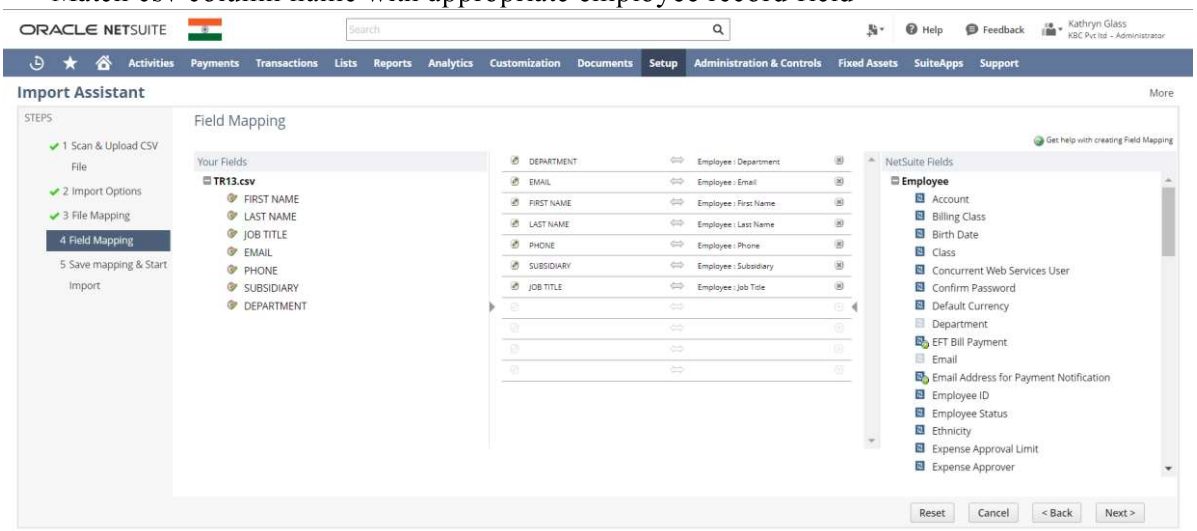
Vishal	Soni	Associate technical consultant	vs@gmail.com	1111111115	Canada	Engineering	

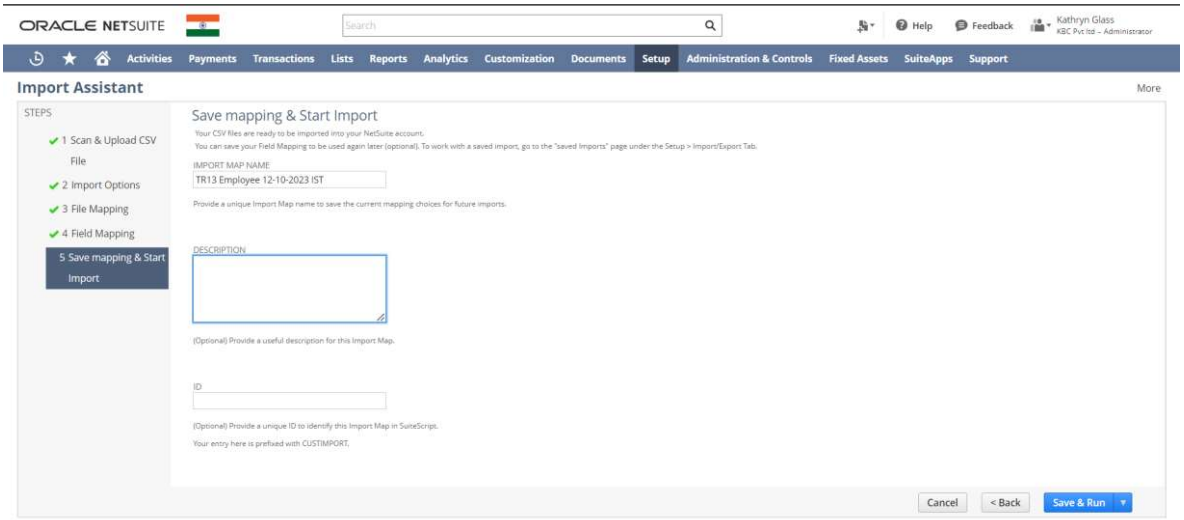
- Select record type: Employee and upload csv file
- Select import type “Add or Update”

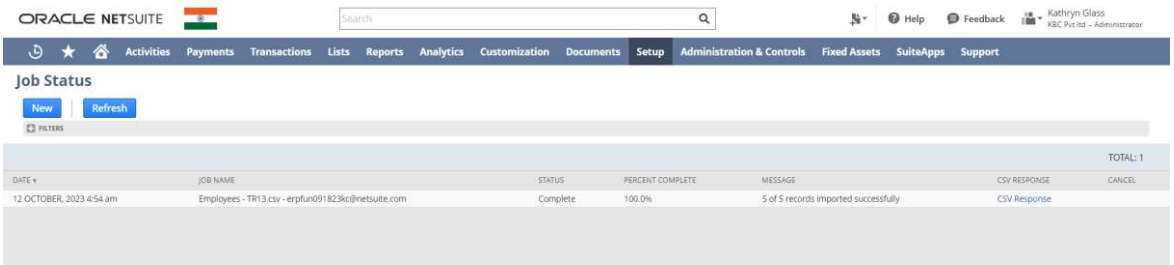




- Match csv column name with appropriate employee record field







- Data of csv filed has been added to existing employee record.

Q.5. How can we check our csv import job status? What is navigation?

Ans. Navigation for csv import job status: Setup > Import/Export > View CSV import status

Q.6. How can we find our existing csv imports? What is navigation?

Ans. Navigation for saved csv import: Setup > Import/Export > Saved CSV import

Q.7.Import csv with false data.

1.Enter Subsidiary which is not present in subsidiary record of NetSuite i.e., India
